                                                                                                                                                                            New isolated and purified ApoptoM peptide comprises 9 amino acids, useful as a vaccine for preventing or treating pathological conditions from non-specific febrile illnesses to severe hemorrhagic manifestations or encephalitic syndromes.
                                                                                                                                                                                                                                                            The present invention relates to an isolated and purified ApoptoM peptide. The invention is useful as a vaccine for the prevention and treatment of pathological conditions from non-specific febrile illnesses pathological conditions, encephalitic syndromes and these pathological conditions are linked to Flavivirus infection or cancers. The invention is also useful in gene therapy. The present sequence is a M1-40/DEN (dengue)-2 (F36) mutant protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gene therapy, protein purification, virucide, cytostatic, vaccine, hemorrhage, bleeding, infection, flavivirus infection, neoplasm, cancer, DEN, dengue, EGFP, enhanced green fluorescent protein.

                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                       The present invention relates to an isolated and purified ApoptoM peptide. The invention is useful as a vaccine for the prevention and treatment of pathological conditions from non-specific febrile illnesses to severe hemorrhagic manifestations, encephalitic syndromes and these pathological conditions are linked to Flavivirus infection or cancers. The invention is also useful in gene therapy. The present sequence is a p(95-114) EGFP (enhanced green fluorescent protein) (M1-M40) DEN (dengue) -2 (136F) plasmid DNA encoded protein.
                                                                                                                          useful
                                                                                                                       New isolated and purified ApoptoM peptide comprises 9 amino acids, useful as a vaccine for preventing or treating pathological conditions from nonspecific febrile illnesses to severe hemorrhagic manifestations or

```
The invention provides novel G coupled protein receptor (GPCR) proteins
and polynucleotides encoding the same. The novel GPCR (NGPCR) proteins
can be expressed by standard recombinant methodology. The NGPCR proteins
and polynucleotides are useful for diagnosis, in treatment of diseases,
car behavioural disorders, for the detection of mutant GPCRs or
inappropriately expressed GPCRX for the diagnosis of disease, and for
screening drugs effective in the treatment of the symptomatic or
phenotypic manifestations of perturbing the normal function of GPCR in
the body. The NGPCR proteins are useful for the generation of antibodies,
as reagents in diagnostic assays, for the identification of other
cellular gene products related to a GPCR, as reagents in assays for
cellular gene products related to a GPCR, as reagents in assays for
cellular gene products related to a GPCR, as reagents in assays for
the reagents compounds that can be used as pharmaceutical reagents for the
therapeutic treatment of mental, biological on medical disorders and
diseases, and for identifying compounds useful in the therapeutic
treatment of obesity, inflammation, immune disorders, diabetes, heart and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     G coupled protein receptor; GPCR; NGPCR; cytostatic; anorectic; cancer; antiinflammatory; immunosuppressive; antidiabetic; human.
The present invention provides the protein and coding sequences of a human guanosine triphosphate-binding protein-coupled receptor (GPCR). sequences are useful for treating diseases related to the abnormality the expression of GPCR, and for developing a therapeutic agent for medical treatment. The present sequence is a protein shown in the exemplification of the invention.

Also included are an expression vector containing the above polynucleotide, a host cell containing the expression vector, a substantially purified human secretin-type GPCR polypeptide, methods of screening for agents which modulate or decrease the activity of a human
metabolic disorders, and cancer. The present sequence

secretin-type GPCR, methods of reducing the activity of the human secretin-type GPCR, the identified modulators, The polynucleotide is useful in preventing, ameliotating, or treating diseases associated with human secretin-type GPCR dysfunction. The polynucleotide may also be used as hybridisation probes or primers, and in diagnostic assays or in genetic testing. The methods are useful in producing and detecting the polynucleotide and polypeptide and in screening of agents that modulate the activity of the human secretin-type GPCR. The expression vector or the activity of a human secretin-type GPCR. The expression vector or the reagent is useful in preparing a medicament for modulating the activity of a human secretin-type GPCR in a disease, such as a cativity of a human secretin-type GPCR in a disease, such as a cativity of a human secretin, adabetes, infection, fangula and protozoan), HIV (human immunodeficiency virus) infection, fungal and protozoan), HIV (human immunodeficiency virus) infection, and in a cancer, anorexia, bullind, asthma, Parkinson's disease, acute heart failure, hypotension, hypertension, urinary retention, osteoporosis, angina pectoris, myocardial infarction, urinary retention, osteoporosis, and in manic depression, delirium, dementia, mental retardation, dyskinesias, Huntington's disease and Tourette's syndrome). The present sequence represents a human secretin type GPCR of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, chromosome mapping, gene mapping, gene therapy, forensic, food supplement, medical imaging, diagnostic, genetic disorder.

in diagnostics as expressed sequence tags for identifying expressed

genes. (I) is useful in gene therapy techniques to restore normal
activity of (II) or to treat disease states involving (II). (II) is
useful for generating antibodies against it, detecting or quantitating a
polypeptide in tissue, as molecular weight markers and as a food
supplement. (II) and its binding partners are useful in medical imaging
of supplement. (II) and (II) are useful for treating disorders
involving aberrant protein expression or biological activity. The
polypeptide and polymucleotide sequences have applications in
diagnostics, forenists, gene mapping, identification of mutentions
responsible for genetic disorders or other traits to assess biodiversity
and to produce other types of data and products dependent on DNA and
amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic
amino acid sequences of the invention. Note: The sequence data for this
patent did not appear in the printed specification, but was obtained in
electronic format directly from WIPO at
the produce of sequences of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the convention of the conventi

                                                                                                                                   This invention describes novel polypeptides which have anti-HIV, antilateriosclerctic, cytostatic, neuroprotective, antiparkinsonian, hepatotropic, laxative, cerebroprotective, antilatmametory, virucide, antibacterial, fungicide and protozoacide activity. The products of the invention are useful for treating a disease or condition associated with decreased expression or over expression of functional g-protein coupled receptors (GCREC), while antibodies generated against the polypeptide of with the expression of GCREC e.g. arteriosclerosis, cirrhosis, cancer, stroke, Alahaimer's disease, Parkinson's disease, Constipation, AIDS, or bacterial, viral, fungal or protozoal infections. The compounds described in the invention can be used for gene therapy. AAB71322-AAB71369 represent the GCREC proteins encoded by AAF8850-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cytostatic; antinflammatory; hepatotropic; nephrotropic; dermatological; antiarthritic; antiasthmatic; antidiabetic; hypotensive; antiulcer; antilipendic; antiarteriosoflerotic; nootropic; neuroprotective; anorectic; immunomodulator; uropathic; antinfertility; G-protein coupled receptor; GPCR, GPCR, BS; GPCR, BS; GPCR, BS; GPCR, BS; GPCR, BS; GPCR, BS; GPCR, BS; GPCR, BS; GPCR, BS; GPCR, BS; GPCR, BS; GPCR, BS; GPCR, BS; GPCR, BS; GPCR, BS; Hepatitis; nephritis; dermatitis; pancreatitis; rheumatoid arthritis; pastematitis; asthma; diabetes; hypertension; inflammatory bowel disease; gastric ulcer; arteriosolerosis; hyperlipemia; Alzheimer's disease; dementia; obesity; pulmonary fibrosis; renal fibrosis; immune deficiency; infertility; urinary blockage; cancer.
New human G-protein coupled receptors (GCREC), useful for diagnosing or treating a disease or condition associated with decreased expression or over expression of functional GCRECs e.g. cancer, Alzheimer's and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                G-protein coupled receptor proteins, genes encoding them and antibodies

The invention relates to G-protein coupled receptor proteins of human crigin. These proteins include GPCR185, GPCR187, GPCR187, GPCR189, GPCR189, GPCR189, GPCR189, GPCR189, GPCR189, GPCR189, GPCR22 and GPGR223. Proteins of the invention are used in the treatment and prevention of diseases associated with inflammation. Creatment and prevention of diseases associated with inflammation, angiogenesis and tissue neogenesis, including hepatitis, nephritis, dermatitis, pancreatitis, rheumatoid arthritis, osteoarthritis, atopic dermatitis, asthma, diabetes, hyperlipemia, Alzheimer's disease, dementia, obesity, pulmonary fibrosis, renal fibrosis, immune deficiency, infertility, urinary blockage and cancer (such as cancer of the brain, neck, tongue, lung, breast, pancreas, stomach, colon, duodenum, prostate, bladder, ovary, womb or rectum). Primers of the invention are devised and synthesised based on G-protein coupled receptor consensus sequences and used for 5'-RACE (rapid amplification of cDNA ends) and 3'-RACE amplification of human cDNA derived from adrenal and visual cortex RNA. Sequences given in ADE34531-ADE34533 represent human G-protein coupled creeptor proteins, genes encoding them, and primers for the amplification ö treatment and diagnosis of cancer, inflammatory and G coupled protein receptor; GPCR; NGPCR; cytostatic; anorectic; cancer; antiinflammatory; immunosuppressive; antidiabetic; human.                              and polymucleotides are useful for diagnosis, in treatment of diseases, or behavioural disorders, for treatment of mutant grows or behavioural disorders, for the diagnosis in treatment of physiological or behavioural disorders, for the diagnosis of disease, and for inappropriately expressed GPCRX for the diagnosis of disease, and for phenotypic manifestations of perturbing the normal function of GPCR in the body. The NGPCR proteins are useful for the generation of antibodies, as reagents in diagnostic assays, for the identification of other cellular gene products related to a GPCR, as reagents in assays for screening compounds that can be used as pharmaceutical reagents for the therapeutic treatment of mental, biological or medical disorders and diseases, and for identifying compounds useful in the therapeutic treatment of obesity, inflammation, immune disorders, diabetes, heart and coronary disease, metabolic disorders, and cancer. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention describes a novel human kidney-originated G protein-coupled receptor protein hTGR21 and the DNA encoding it. The proteins, DNAs and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to G-protein coupled receptor proteins of human origin. These proteins include GPCR185, GPCR187, GPCR189, GPCR189, GPCR189, GPCR189, GPCR189, GPCR223. Proteins of the invention are used in the treatment and prevention of diseases associated with inflammation, anglogenesis and tissue neogenesis, including hepatitis, nephritis, dermatitis, pancreatitis, rheumacoid arthritis, osteoarthritis, atopic dermatitis; athma, diabetes, hypertension, inflammatory bowel disease, gastric ulcer, arteriosclerosis, hyperlipemia, Alzheimer's disease, dementia, obesity, pulmonary fibrosis, renal fibrosis, immune deficiency,
screened compounds are useful for developing drugs to treat central nervous diseases, endocrine diseases, metabolic diseases, cancer, inflammations, and diseases of the circulatory, respiratory, digestive and immune systems, and infections, and in gene therapy. This is the amino acid sequence of the human G protein-coupled receptor hTGR21-1, a novel protein isolated from human kidney
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                G-protein coupled receptor proteins, genes encoding them and antibodies recognizing them for treatment and diagnosis of cancer, inflammatory and

infertility, urinary blockage and cancer (such as cancer of the brain, neck, tongue, lung, breast, pancreas, stomach, colon, duodenum, prostate, bladder, voxry, womb or rectum). Primers of the invention are devised and synthesised based on G-protein coupled receptor consensus sequences and used for S'-RACE (rapid amplification of cDNA ends) and 3'-RACE amplification of cDNA ends) and 3'-RACE Sequences given in ADE34534-ADE34533 represent human G-protein coupled receptor proteins, genes encoding them, and primers for the amplification of these sequences.

The invention relates to human and mouse G protein-coupled receptors (GPCRs) and nucleic acids encoding them. The invention also relates to sequences at least 90% identical to the GPCR proteins and nucleic acids of the inventing or diagnosing diseases associated with GPCRs of the inventing preventing or diagnosing diseases.

CC compounds useful in the treatment of GPCR-related diseases, a transgenic compounds useful in the treatment of GPCR-related diseases, a transgenic mouse comprising a GPCR transgene or in an endogenous GPCR gene; cells derived from the trasngenic mice; kits comprising several mice, each of which has a mutation in a GPCR transgene or in an endogenous GPCR gene; cells derived from the trasngenic mice; kits comprising several mice, each of which has a mutation in a different GPCR polymolecides of the invention. The envertion is a wide variety of probes which hybridise to GPCR polymolecides of the invention. The envertion is a wide variety of invention further discloses variants of the GPCR polymolecides of wide variety of invention further discloses variants of the GPCR polymolecides of the invention. The discorders of the adrensional disorders (e.g., Alzheimer's disease, depression, diabetic neuropathy, Parkinson's disease or schizophrenia); disorders of the adrenal gland; disorders of the color or infraction) muscular disorders of the color or infracting enveryment of disorders (e.g., augina, cardiac arrhythmia or mycomedicial miscrelars (e.g., augina, remained or leukaemia); immune disorders (e.g., augina, remained or leukaemia); immune disorders (e.g., augina, remained or leukaemia); immune disorders (e.g., augina, remained or leukaemia); immune disorders (e.g., augina, remained disorders of the kidney, liver, lung, breast, obesity, enzyme deficiency-related diseases or vitamin deficiency-related diseases); and disorders of the kidney, liver, lung, breast, thymus and chinted specification, those sequences not shown were obtained in thy without long the printed specification the sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  receptor; GPCR; guanosine triphosphate-binding protein-coupled receptor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                             The present invention provides the protein and coding sequences of a human guanosine triphosphate-binding protein-coupled receptor (GPCR). The sequences are useful for treating diseases related to the abnormality of the expression of GPCR, and for developing a therapeutic agent for medical treatment. The present sequence is the protein of the invention.
New polynucleotide encoding guanosine triphosphate-binding protein-
coupled receptor, for use in developing a therapeutic agent for medical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; G-protein coupled receptor; GCREC; olfactory; taste sensation; cell proliferative disorder; actinic keratosis; leukaemia; metabolic; epilepsy; Alzheimer's disease; cardiovascular; hypertension, virucide; angina pectoris; myocardial infarction; gastrointestinal; anorexia; cholecystitis; Crohn's disease; inflammatory; hypotensive; cardiant; acquired immune deficiency syndrome; anaemia; asthma; hepatotropic; diabetes; obesity; infection; transgenic; gene therapy; cytostatic; anticonvulsant; neuroprotective; antiinflammatory; neurological; nootropic; ancectic; autoimmune; receptor.

The invention relates to human G-protein coupled receptors (GCREC) and their corresponding nucleic acids. GCREC is useful in screening for compounds which acts as its agonist or antagonist and is also useful for preparing a polyclonal or monoclonal antibody. GCREC is useful for identifying a compound that modulates, mimics and/or blocks an olfactory and/or taste sensation. GCREC DNA is useful for assessing toxicity of a cest compound. GCREC and its DNA are useful in the diagnosis, treatment are test compound. GCREC and its DNA are useful in the diagnosis, treatment and prevention of a cell proliferative disorder e.g. actinic keratosis, and prevention of a cell proliferative disorder e.g. actinic keratosis, clienaemia, etc., a cardiovascular disorder e.g. appliepsy, Alzheimer's disease, etc., a cardiovascular disorder e.g. appliepsy, Alzheimer's concexia, cholecystitis, Crohn's disease, etc., an autoimmune/cinfimmancy disorder e.g. acquired immune deficiency syndrome, anaemia, asthma, etc., a metabolic disorder e.g. diabetes, obseity, etc., and an infection by a viral agent such as adenovirus, arenavirus, etc., dat an infection by a viral agent such as adenovirus, arenavirus, etc. GCREC DNA is used for creating knock out or knock in humanised animals or transgenic animals to model human diseases, and somatic or germine gene in human diseases, and somatic or germine equence in human general sequence in human diseases, and somatic or germine equence in human general sequence in human diseases, and somatic or germine equence in human diseases, and somatic or germine equence in human diseases, and somatic or germine equence in human diseases, and somatic or germine equence in human diseases, and somatic or germine equence in human diseases, and somatic or germine equence in human diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; receptor; GPCR; G protein-coupled receptor; secretin; obesity; cardiovascular disorder; diabetes; infection; HIV; pain; cancer; human immunodeficiency virus infection; anorexia; bulimia; asthma; Parkinson's disease; acute heart failure; hypotension; hypetrension; urinary retention; osteoporosis; angina pectoris; myocardial infarction; ulcer; allergy; benign prostatic hypertrophy; psychosis; neurological disorder; anxiety; schizophrenia; manic depression; delirium; dementia; mental retardation; dyskinesia; Huntington's disease;

The invertion relates to an isolated polynucleotide winch: (a) encodes a human secretin-type G protein-coupled receptor (GPCR) polypeptide; (b) comprises a sequence appearing as ABX15278 and ABX15279; (c) hybridises a sequence appearing as ABX15278 and ABX15279; (c) hybridises a sequence deviating from (A) - (C) due to the degeneration of the genetic code; or represents a fragment, derivative or allelic variation of (A) - (C). Also included are an expression vector containing the above code; or represents a fragment, derivative or allelic variation of (A) - (C). Also included are an expression vector containing the above code; or sequentially purified human secretin-type GPCR polypeptide, methods of reducing the activity of the human secretin-type GPCR, wethods of reducing the activity of the human secretin-type GPCR, the identified modulators, The polymucleotide is secretin-type GPCR, the identified modulators, The polymucleotide with human secretin-type GPCR dysfunction. The polymucleotide may also be used as hybridisation probes or primers, and in diagnostic assays or in genetic testing. The methods are useful in producing and detecting the polymucleotide and polypeptide and in screening for agents that modulate code the activity of the human secretin-type GPCR. The expression vector or the reagent is useful in preparing a medicament for modulating the cotivity of the human secretin-type GPCR. The expression vector or the reagent is useful in preparing a medicament for modulating the cotivity of a human secretin-type GPCR in a disease, such as a cativity of a memory and an immunodeficiency virus) infection, fungal and protozoan), HIV (human immunodeficiency virus) infection, cativity of a morexia bullina, asthma, parkinson's disease, acute heart cfailure, hypotension, hypertension, urinary retention, osteoporosis, angina pectoris, morexia, bulnima, asthma, parkinson's disease, acute as a cativity of any manic depression, urinary retention, osteoporosis, angina pectoris, municatoris, municatoris, municatoris,
                                                                                                                                                                                       New isolated polynucleotide encoding human secretin-type G protein-coupled receptor (GPCR) polypeptides, useful for preventing or treating diseases associated with GPCR dysfunction, e.g. cardiovascular disease or
                                                                                                                                                                                                                                                                                                                                                                invention relates to an isolated polynucleotide which: (a) encodes a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain creation (PGR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders involving abberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations cresponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this parent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at (II) wipo.int/pub/published_pot_esquences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ligand; orphan receptor protein; fusion protein; fluorescent protein; cell expression; green fluorescent protein; GFP; GFP-1; wild-type GFP; GFPuv; Enhanced GFP; EGFP; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                       New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ..

                                                                                                                                                                                                                                                                                                                                                                                      This invention relates to a novel method of identifying ligands to an orphan receptor protein which comprises transforming cells with DNA encoding a fusion protein of the orphan receptor with a fluorescent protein, so that the fusion protein is expressed in the cells (or cell membranes isolated from them) and contacting the cells with the potential ligand to be tested. A suitable fluorescent protein for incorporation in the fusion protein is green fluorescent protein (GFP), for example GFP-1, wild-type GFP, GFPPU or EGFP). The method is useful for the identification of ligands binding to an orphan receptor protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Bioinformatics; blood; serum; plasma protein; protein detection; mass spectroscopy; proteomics; glycosylation; diagnosis; cancer; cytostatic; diabetes; antidiabetic; inflammation; antinflammatory; rheumatoid arthritis; antiarthritis; antirheumatic; psychiatric disorder; neuroleptic; neurological disease; infection; antimicrobial.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    21-SEP-2000;
                                                                                                                                                                                                                                                                                                                     14-AUG-2000;
      The invention relates to identifying glycopolypeptides in a serum or plasma sample comprising immobilizing derivatized sample glycopolypeptides to a solid support, releasing the sample glycopetide (a solid support, adding to the released sample fragments standard peptides, and identifying released sample glycopeptide fragments that correspond to the released sample glycopeptide fragments that correspond to standard peptides added by mass spectroscopy. Also included are a method for identifying one or more diagnostic markers for a disease, a composition comprising peptides correspond to peptide fragments derived by cleavage of polypeptides correspond to peptide fragments derived by cleavage of polypeptides correspond to peptide fragments derived by cleavage of polypeptides correspond to peptide fragments derived by cleavage of polypeptides correspond to peptide fragments derived by cleavage of polypeptides correspond and a kit comprising peptides containing the glycosylation sites (AEE35897-AEE39378). The methods are useful for identify and grocein markers: It can also be used to identify and/or can be used for blood serum profiling for the detection of fragmostic and diagnostic protein markers: It can also be used to identify and/or can be used for protein abundance measurement of protein glycosylation on the concurrent correspond to protein abundance measurement of protein glycosylation on the cancurrent correspond an also be automated to facilitate the processing of multiple samples. The present sequence is a human glycopeptide comprising an N-enthod of the invention.
Identifying glycopolypeptides in a serum or plasma sample, by identifying released sample glycopeptide fragments that correspond to standard
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; respiratory antigen; respiratory disorder; throat disorder; lung disorder; nose disorder; lung cancer; gene therapy; cytostatic; anti allergic; anti asthmatic; anti inflammatory; olfactory; respiratory active.

HUMAN GENOME SCI INC. (HUMA-) Rosen CA, Ruben SM, Barash

WPI; 2003-902033/82. N-PSDB; ADG40857.

Novel respiratory system antigen and polynucleotides encoding the polypeptides, useful for treating diagnosing, treating or preventing tonsillitis, pneumonia, asthma and cystic fibrosis, emphysema, throat cancer.

Claim 11; SEQ ID NO 387; 236pp; English

The invention describes an isolated polypeptide (I) comprising an amino acid sequence that is at least 90% identical to polypeptide fragment of any one of 299 respiratory system antigen sequences (PS) and having biological activity, polypeptide domain or epitope of PS, full-length protein of PS, or variant, allelic variant or species homolog of PS (I) or a polymucleotide (II) encoding (I) is also useful for diagnosing a pathological condition or a susceptibility to a pathological condition or a susceptibility to a pathological condition in (II) or determining the presence or absence of mutation in (II) or determining the presence or amount of expression of (I) in a biological sample and diagnosing a pathological condition based on the result. The human respiratory system associated polynucleotides, the polypeptides encoded by them, and antibodies that immunospecifically bind these polypeptides are useful in diagnosis, treatment, prevention and/or prognosis of disorders of respiratory system such as throat disorders

polypeptide #76

(first entry)

17-JAN-2003 Human novel

ABG99963 standard; protein; 52 AA

ABG99963

```
This invention is related to a novel isolated polypeptide, which comprises a human respiratory system-related polypeptide, and the DNA sequence which encodes it. The invention may be useful for the development of compounds with an antiasthmatic, antibacterial, antiinflammatory, cytostatic, antianaemic or antiallergic activity. In addition, the sequences disclosed may be useful for gene therapy. The polypeptide or polymuclectide is useful for treating, preventing or memical condition, for example pneumonia, lung cancer, cystic fibrosis, asthma, sarcoidosis, thinitis, anaemia, leukaemia, inflammations, sinusitis, chronic observative pulmonary disease or disgnosing any of these diseases or a susceptibility to the disease. The polypeptide or polymuclectide is also useful for disgnosing any of these diseases or a susceptibility to the disease. The polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New human respiratory system-related polypeptide and genes, useful for treating, preventing or diagnosing e.g. pneumonia, lung cancer, cystic fibrosis, asthma, sarcoidosis, rhinitis, leukemia, inflammations or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            55.6%; Score 5; DB 7; Length 34; 100.0%; Pred. The invention relates to human polynucleotides and the polypeptides they encode. The polynucleotides and polypeptides are useful in diagnostics, forenaises, gene mapping, medical imaging, identification of mutations responsible for genetic disorders or other traits, assessing biodiversity and producing many other types of data and products dependent on DNA and amno acid sequences. They are also useful for preventing, treating or amino acid sequences. They are also useful for preventing or amino acid sequences. They are also useful for preventing or disorders (e.g. Parkinson's disease, Alzheimer's disease), lymphoid cell disorders (e.g. Parkinson's disease, Alzheimer's disease), lymphoid cell disorders, osteoporosis, osteoarthritis, bone degenerative disorders, periodontal diseases (e.g. diabetes, atopic dermatitis).

Sequences ABG99888-ABG9988 and ABU00010-ABU00433 represent human contropersore of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ..

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by e. acnes. The disorders include SAPHO syndrome (synovitis, acne, practice) and placed and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaria. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a manger be amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to demregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by cingmostic agents for determining P. acnes presence, for example, by chis patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                          SAPHO syndrome; synovitis; acne; pustulosis; hypertosis; osteomyelitis; uveitis; endophthalmitis; bone; joint, central nervous system; ELISA; inflammatory lesion; acne vulgaris; enzyme linked immunosorbent assay; dermatological; osteopathic; neuroprotectant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful for

The invention relates to an isolated polymucleotide (ACF64435-ACF64733)

Concoding a Propionibacterium acnes protein. The invention also relates to polypeptides encoded by the polymucleotides (ABM35624-ABM64536) and to immunogenic fragments of P. acnes polypeptides. The invention additionally encompasses expression vectors and host cells comprising a additionally encompasses expression vectors and host cells comprising a collymetrion, fusion proteins comprising a polymetrion of the invention; an erbod for stimulating an immune response specific for a P. acnes to polymucleotides, and an isolated T cell population comprising T cells prepared via this method, a vaccine composition (comprising P. acnes polypeptides, polymetriolectides, antibodies, fusion proteins, T cell populations, or antigen-presenting cells that express the polymetriolectides, and an extend for inhibiting the development of P. acnes in a consider that express the polypeptides, polymetrioles, in a method for inhibiting the development of P. acnes in a conteins, T cell populations or antigen-presenting cells that express the colypeptides are useful for diagnosing, preventing or treating acnes to polypeptides are useful for diagnosing, preventing or treating acnes contoucied acid hybridasation. The vaccine composition is useful for the stimulating an immune response specific for a P. acnes for nucleic acid hybridasation. The vaccine composition is useful for the stimulating and immune response against P. acnes, or for treating acnes and the kit is useful for performing a diagnostic assay. The present of sequence represents a polypeptide present or reading very many or an immune for the polymetric assay. The present of sequence represents a polypeptide present or and the polymetric and present or a polymetric and the polymetric and present or an account of an immune response against P. acnes, or for treating account of an immune response applymentation be encoded by an ORF for many or and the polymetric acid by present and the polymetric acid prese
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            invention. Note: The sequence data for this parent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Maisonneuve JL;

```
AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (1) and acid sequences given in AAM82170 to AAM91921. (1) have cytostatic activity, and can be used in gene therapy and vaccine production. (1) proteins and polyvucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (1) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations of deletions in a patient's genome that affect the activity of (1) by expressing inactive proteins or to supplement the patients own production of (1). Additionally. (1) polynucleotides may be used to produce the secreted (1), by inserting the nucleic acids into a host cell and culturing the cell to express the cancer metatiases of haematopoietic-related diseases, especially cancers and cancer metastases of haematopoietic-derived cells. AAK64703 concers and cancer human immune/haematopoietic antigen genomic concers metastases of haematopoietic antigen genomic procession invention. AAK454912 to AAK54500 and AAM82169 represent sequences trom the present invention. AAK45491 to AAK54500 and AAM82169
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cell death protective; apoptosis; necrosis; human; drug screening; cell death-associated disorder; central nervous system disorder; psychiatric disorder; neurological disorder; ischaemia-related disorder; stroke; cerebral infarction; ischaemic encephalopathy; neurodespenerative disorder; Alzheimer's disease; Huntington's disease; Parkinson's disease; infection; meningitis; malaria; trypanosomiasis; vascular desease; opthalmological disorder; diabetic refinopathy; ancular degeneration; hypertension; myocardial infarction; atherosclerosis; respiratory disorder; asthma; transgenic animal; chronic obstructive pulmonary disease; neoplastic condition; cancer;
                                                                                                                                                                                                                                                                                                                                                                                    Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human cell death protective cDNA clone CNI-00720 ORF3 protein, SEQ:267.

WPI; 2001-616774/71. N-PSDB; AAS59546 Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful for treating acne vulgaris.

Example 1; SEQ ID NO 11227; 1069pp; English.

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by a canes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. The acnes is also involved in infections of bone, joints and the central convolutions asystem, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the research of P. acnes in a patient comprises contacting a cample with a binding agent that binds to the proteins of the invention of and determining the amount of bound protein in the sample. The and determining the amount of bound protein in the sample. The contacting a contracting and determining the amount of bound protein in the sample. The contacting and activity of P. acnes polypeptides and downregulate expression and activity of P. acnes polypeptides and converse in the production of antibodies can be used as contactions. The antibodies may also be used as contactions of therefore treat P. acnes infections. The antibodies may also be used as contacting p. acnes proteins and activity of P. acnes polypeptides and converse the sample of the sample. By converse infections of the antibodies may also be used as converse and activity of P. acnes proteins for determining p. acnes presence, for example, by converse infections of the printed specification, but was for the print in the production of the printed specification, but was the production of the printed specification, but was the production of the printed specification, but was the production of the printed specification, but was the production of the printed specification, but was the production of the printed specification of the printed specification of the printed specification of the printed specification of the printed specification of the printed specification of the printed specificatio obtained in electronic format directly fr ftp.wipo.int/pub/published_pct_sequences

Maisonneuve JL; Jones R, Carter D; Persing DH, Bhatia A, Lodes MJ, Benson DR, Mitcham JL, Skeiky YAW, Pers Zhang Y, Wang S, Jen S, Lod Barth B, Vallieve-Douglass J;

WPI; 2003-381789/36. N-PSDB; ACF64475 New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.

Example 1; SEQ ID NO 11227; 1481pp; English.

CC immunogenic fragments of P. acues polypeptides. The invention additionally encompasses expression vectors and host cells comprising a additionally encompasses expression vectors and host cells comprising a polypeptides. The invention additionally encompasses expression vectors and host cells comprising a polypeptide of the invention; and immunogenic of the invention; and immunogenic of the invention; and immune response specific for a P. acues comprising a polypeptide of the invention; and an isolated T cell population comprising T cells prepared to the invention of the invention; and immune response specific for a P. acues polypeptides, antibodies, fusion proteins, T cell populations, or antigen-presenting cells that express the polypeptide); a method and kit for detecting or determining the presence or absence of P. acues in a patient; and a method for inhibiting the development of P. acues in a patient; and a method for inhibiting the development of P. acues in the patient; and a method for inhibiting the development of P. acues in the patient; and a method for inhibiting the development of P. acues in the patient. The P. acues polypeptides, polymucleotides, antibodies, fusion proteins, T cell populations or antigen-presenting cells that express the collypeptides are useful for adagnosing, preventing or treating acue vulgaris, or for stimulation of an immune response against P. acues probes or primers for the cetting frame) contained within the P. acues polymucleotides can all for performing a diagnostic assay. The present sequence cadar for this patent did not form part of invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from William will be performed by the sequences. The invention relates to an isolated polynucleotide (ACF64435-ACF64733) encoding a Propionibacterium acnes protein. The invention also relates to polypeptides encoded by the polynucleotides (ABM35624-ABM64536) and to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes substantially purified human proteins

(referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1

(referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1

in the specification). ABN15762 to ABN27525 encode the human ORFX

contains given in ABB0010 to ABP11500. ORFX proteins are useful for

treating or preventing a pathology associated with an ORFX-associated

disorder in humans, and in the manufacture of a medicament for treating a

contained of cancer, hyperproliferative disorders. ORFX polynucleotide

sequences can be used in gene therapy. ORFX sequences can be used in the

treatment of cancer, hyperproliferative disorders, cirrhosis of liver,

psoriasis, benign tumours, keloid, degenerative disorders has monthage,

consequences can be used in generative disorders, cirrhosis of liver,

psoriasis, benign tumours, keloid, degenerative disorders related to organ

transplantation, cardiovascular diseases, diabetes mellitus, systemic

transplantation, cardiovascular diseases, diabetes mellitus, systemic

consequences and autoimmune disorders such as multiple sclerosis, infectious

diseases, autoimmune disorders such as multiple sclerosis, internated

consequences and autoimmune inflammatory eye disease. ORFX proteins are also

cuseful for treating burns, incisions, ulcers, for treating osteoporosis,

consequences are regeneration and treatment of lung or liver fibrosis,

creperfusion injury in various tissues and conditions resulting from

systemic cytokine damage. N.B. The sequence data for this patent did not

form part of the printed specification, but was obtained in electronic

c death, and to screen for compounds which modulate their activity or death, and to screen for compounds which modulate their activity or expression. Such modulators, preferably a small organic molecule, an antibody, a ribozyme, or an antisense molecule, can also be used to treat central nervous system including psychiatric or neurological disorders, especially ischeamia-related conditions such as strokes, and also includes neurodegenerative disorders such as Alzheimer's disease, with includes neurodegenerative disorders such as Alzheimer's disease, conditions entral new a section such as meningitis, malzala, or trypanosomiasis, vascular diseases such as meningitis, malzala, or trypanosomiasis; eye conditions such as lachemic encephalopathy or cerebral infarction, typertension, myocardial infarction; sheroscierosis; respiratory conditions such as asthma or chronic obstructive pulmonary disease; conditions such as cancers or benign tumours; blood cell conditions such as cancers or benign tumours; blood cell or ulcerative colitis; liver conditions such as pastrointestinal conditions such as gastrointestinal tions such as gastrointes or immune system disorders conditionally be used to generate animal models of cell death-associated conlumentials.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

                                                                                                                                                                                                                                       셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to novel excretory system related human polynucleotides (AAI98567-AAI99503) and the encoded proteins (AAM99594-AAM99913) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy, especially disorders related to the excretory system. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Isolated nucleic acid molecule encoding excretory system antigen is used in preventing, treating or ameliorating a medical condition.

WPI; 2001-488784/53. N-PSDB; AAI63213.

Claim 11; SEQ ID NO 528; 564pp + Sequence Listing; English

New isolated nucleic acids and polypeptides, useful for diagnosing, treating and/or preventing human diseases and disorders.

The invention relates to novel kidney related polynucleotides (AAM62971-AAM6293) and the encoded polypeptides (AAM42417-AAM42691) collectively known as kidney antigens and the use of such kidney antigens for concern metastases. The polynucleotides and proteins are also useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and ent) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer, and other cancers of the arenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urgomital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid are retritits and ulcerative colitis; (c) cardiovascular disorders such as wirely cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, batent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequences ABP31028-ABP35561 represent 4534 novel human proteins designated ORF (open reading frame) 1-4534, and sequences ABN75054-ABN75957 represent CONAs encoding them. The invention also encompasses polypeptides at least 80% identical to the ORF1-ORPA534 (collectively referred to as ORFX) proteins, polynucleotides at least 85% identical to the ORFX nucleic acid sequences, vectors and host cells comprising ORFX polynucleotides, the recombinant production of ORFX proteins, antibodies specific for ORFX proteins, methods of detecting ORFX polynucleotides and polypeptides, methods of screening for modulators of ORFX expression or activity, and methods of screening individuals for a predisposition to an ORFX associated disorder. The ORFX proteins of the invention have a wide range of biological activities, such as cytokine, cell proliferation,

cell differentiation, immune modulation, haematopoiesis regulation, contissue growth, angiogenesis, activin or inhibin activity, chemotactic/confementationetic activity, tumour inhibition activity, receptor/ligand, antiinflammatory activity, tumour inhibition activity, and antiinflective activity, and may also be involved in the determination of bodily characteristics, fertility and behaviour. ORFX protebins, or bedily characteristics, fertility and behaviour. ORFX protebins, corbodily characteristics, fertility and behaviour. ORFX protebins, corbodily characteristics, fertility and behaviour. ORFX protebins, corbodily characteristics, fertility and behaviour. ORFX protebins, corpus and antibodies may be used in the treatment of cancers, corpus transplantation, disorders such as epilepsy and Alzheimer's disease.

CC cardiovascular diseases, immune system disorders, disorders related to organ transplantation, disorders of tissue growth and regeneration, disorders mellitus, hypothyroidism, and cholesterol ester corpus and probes, in the detection of ORFX genomic sequences or transpripts, in the identification and cloning of homologous corpusation, in genetic diagnosis, and in foremaic belongy. The ORFX cource of primers may additionally be used to produce transgenic animals content, and in drug screening. The ORFX proteins may also be used as immunogens to generate specific antibodies, which are useful in the content and monitoring of ORFX-associated diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New recombinant DNA constructs useful in the field of biochemistry and genetics, and in particular for producing transgenic plants with improved biological characteristics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               plant, transgenic, cold tolerance, growth rate, drought tolerance; disease resistance; galactomannan production; plant growth regulator; heat tolerance, herbicide tolerance; lignin production; extreme osmotic condition tolerance; pathogens resistance; pest resistance; pest resistance; yield improvement; seed oil yield; seed protein yield.

Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful for

treating acne vulgaris.

C (SEQ ID NO: 5545-11088). The CDMAs and proteins are from corn, soybean, C (SEQ ID NO: 5545-11088). The CDMAs and proteins are from corn, soybean, sequences is derived from which organism. Also included is a method of producing a plant having an improved property, comprising a method of plant with a recombinant DNA construct comprising a promoter region of plant with a recombinant DNA construct comprising a promoter region of plant a plant cell operably joined to a polynucleotide encoding a plant cell operably joined to a polynucleotide encoding a plant to large selected from improving plant cold tolerance, for manipulating growth rate in plant cells by modification of the cell cycle plant frought registrance to plant disease, for adjactomannan production, for production of plant disease, for improving plant heat tolerance to extreme computers, for improving plant tolerance to extreme computers, for improving plant tolerance to extreme computers, for improving plant tolerance to extreme computers, for improving plant tolerance to extreme computers, for improving plant tolerance to extreme computers, for yield improvement by modification of plant growth regulators, for improving plant tolerance to extreme computer, for yield improvement by modification of compositions for modifying seed protein yield and/or content, for yield improvement by modification of development under at least one stress condition. The polymucleotide may and for yield improvement by providing improved plant growth and modification of carbohydrate, nitrogen or phosphorus use and/or uptake and for yield improvement by providing improved plant growth and gevelopment under at least one stress condition. The polymucleotide may are useful in the field of biochemistry and compositions of the present invention are useful in the field of biochemistry and cological characteristics such as increased yield, improved by improved by also enced a plant tolerance to plant persent sequence to optain persent sequence to optain persent sequence is one of th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
The invention relates a recombinant DNA construct comprising a polynucleotide having any of 5544 nucleotide sequences (cDNAs SEQ ID NO: 1.5544) and encoding a polypeptide with any of 5544 amino acid sequences (SEQ ID NO: 5545-11088). The CDNAs and proteins are from corn, soybean,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ó

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by 2. A acnes. The disorders include SABHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. The acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the cample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The collypeptides may be used as antigens in the production of antibodies of specific for P acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and close treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes proteins of clasmostic agents for determining P. acnes protein the sequence data for chargement inked immunosorbent assay (ELISA). Note: The sequence data for the intime intime in the protein but was for it intime intime format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The invention relates to an isolated polynuclectide (ACF64435-ACF64733)

cenceding a Propionibacterium acnes protein. The invention also relates to polypeptides encoded by the polynucleotides (ABM35624-ABM64536) and to immunogenic fragments of P. acnes polypeptides. The invention additionally encompasses expression vectors and host cells comprising a comprising a polypeptide of the invention; tusion proteins comprising a polypeptide of the invention; tusion proteins comprising proteins comprising a polypeptide of the invention; and the present of comprising T cells prepared to polypeptide and an isolated T cell population comprising T cells prepared to polymuclectides, antibodies, fusion proteins, T cell populations, or antigen-presenting cells that express the polypeptide); a method and kit for detecting or determining the presence or absence of P. acnes in a compatient; and a method for inhibiting the development of P. acnes in a patient. The P. acnes polypeptides, polymuclectides, antibodies, fusion proteins, T cell populations or antigen-presenting cells that express the polypeptides are useful for diagnosing, preventing or treating acne protein. The polymuclectides can also be used as probes or primers for the primulation of an immune response specific for a P. acnes or protein. The polymuclectides can also be used as probes or primers for and the kit is useful for performing a diagnostic assay. The present cadants from the kit is useful for performing a diagnostic assay. The present cadants framely contained within the P. acnes polymuclectides of the framely contained within the P. acnes polymuclectides of the first framely contained within the P. acnes polymuclectides of the first first first in the primers for the primer form and the first first first for the primer form and the first first first for the primer form and the first for the primer form and the first for the primer form and the first form and the first first first form and the form form form form form form and form form form form form form 
                                                                                                                                                                                                             New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.

The invention describes a recombinant DNA construct comprising a polymucleotide consisting of a sequence encoding an amino acid sequence available in electronic form from the US patent office at the sequence. Large of the US patent of Fice at the Sequence as also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme compositions, pathogens or pests, for manipulating growth rate in plant collab by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing galactomannan, combination in plants, for increasing the rate of homologous recombination in plants, for improving yield by modification of photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one stress condition or for modifying seed oil or protein yield and/or content. This is the amino acid sequence of a plant full length insert polymetric that can be used in the recombinant DNA construct of the

                                                                                                                                                                                                                             The invention relates to a substantially purified nucleic acid molecule encoding a nitrite reductase of SEQ ID NO. 11926. Further disclosed is a recombinant DNA construct for expression of a nitrite reductase gene in a plant cell, and a plant cell comprising the recombinant DNA construct. The nucleic acid is useful for determining gene expression, identifying mutations in a gene of interest, and for constructing mutations in a gene of interest. Sequences given in records for SEQ IDS 9692-16825 represent a group of 7134 Mxyococcus xanthus proteins and peptides. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       anticonvulsant; nootropic; neuroprotective; cerebroprotective; anti-HIV; antiallergic; antinfiammatory; thyromimetic; gene therapy; cell proliferative disorder; endocrine disorder; neurological disorder; immune system disorder; infiammatory disorder; developmental disorder; reproductive disorder; vesicle-trafficking disorder; infection.
                                                                                                                                                 New substantially purified Myxococcus xanthus nucleic acid molecule encoding a nitrite reductase, useful for determining gene expression, identifying mutations in a gene of interest, and for constructing mutations in a gene of interest.
                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The invention relates to a novel isolated human enzyme (ENZM)

polypeptide. A polypeptide of the invention has cytostatic,
antiatteriosclerotic, antidabetic, antidabetic, antidabetic, antidabetic, antidabetic, antidabetic, antidabetic, antidabetic, antidabetic, antidabetic, antidabetic, antidabetic, antidabetic, antidabetic, antidabetic, antidabetic, antidabetic, antidabetic, antidabetic, antidabetic, antidabetic, antidabetic, antidabetic, antidabetic, antidabetic, antidabetic, antidabetic, antidaposing, treating and polypeptides and polynuclocides are useful in diagnosing, treating and preventing diseases or conditions associated with the decreased expression or overexpression of ENZM, such as cell proliferative (e.g. cancer, atherosclerosis), endocrine (e.g. diabetes), neurological (e.g. cancer, atherosclerosis), endocrine (e.g. diabetes), neurological (e.g. epilepsy, Huntington's disease, atroke), immune/inflammatory (e.g. AIDS, allegies), developmental (e.g. Hypothyroidism, Cushing's syndrome), reproductive and vesicle-trafficking disorders, or infections. These are also useful in assessing the effects of exogenous compounds on the expression of nucleic acid and amino acid sequences of ENZM. The ENZM or its fragments are useful in screening compounds for effectiveness as a gonit or antagonist of the polypeptide, or in altering the expression of the target polynucleotide and compounds that specifically bind to or moditoring or measuring protein-protein interactions, and gene expression profiles. The sequences shown in ADC14195-ADC14247 represent ENZM proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New human enzymes (ENZM), useful for diagnosing, treating and preventing diseases or conditions associated with the aberrant ENZM expression e.g. cancer, diabetes, epilepsy, or infections.
                                                                                                                                                                                                                                                                                                                                       Baughn MR;

This invention describes novel polypeptides and their encoding nucleic acids derived from human pancreatic tumor tissue which have cytostatic activity. The sequences are also useful in producing pharmaceutical compositions for treatment of pancreatic tumors. AAYT3814-Y74252 represent protein fragments encoded by the human pancreatic tumor cDNA library derived expressed sequence tag (EST) sequences represented in AAZ52858-Z53014
                                                                                                                                                                                                                                                     New human nucleic acid sequences from pancreatic tumors, and related
